Good Morning Lynn,

I conducted a site visit last Friday (10-24-14) at both Hudson and Medina to determine what had caused the red discoloration seen in the photographs you provided. I did confirm that the red coloration is rust staining on the cement behind the milkhouse. The rust is being caused by the temporary draining of clean well water over the cement. The water is being used to calibrate the bulk tank to the capacity it will need to run at when the sites are milking at full capacity. At both locations, the water drains to catch basins that go to the storm water storage pits.

While I was at Medina I also inspected the hose from the storm water pond that you had identified in the photographs. The hose was used during the growing season to route water from the storm water storage pit to two irrigation pivots used for watering row crops.

Thank you, Rachel

Subject: Medina Dairy, Hudson Dairy question please?

Good morning all,

Could you please tell me what may be discharging from the milkhouse area at the Medina (0730) and Hudson Dairies (0507)? It appears red in color, may be discharging on the ground and possibly to a stormwater drain at Medina Dairy, and into a possible tile line at the Hudson Dairy behind the milkhouse area?

I have marked the areas on the aerial photos that were taken yesterday by Lighthawk/SRAP.
